

Overview

The project called *mendonca-messenger* allows the user to send and receive messages through the network by using the web browser.

The application at this moment permits the communication with two kinds of messages, text and audio messages.

I have create a video with a little demo of the project.

Video demo - <https://youtu.be/eRyPttNZ96Y>

Features

-Login

The Login screen allows the user pre-registered in the system to use it features.

Only users who are authenticate can send and receive messages, thought the project.

Access by the link <https://<yourIP>:8443/myLogin>

User Name	
Password:	
Authenticate	

Observation – At the moment where the this documentation is being creating the Login screen still required some improvements like mask in the password, use a more background friendly colour, centralized the fields, etc.

- Online status

The online status feature highlight the with the colour **green** users who are currently online and with **red** users who are off-line. If the user became on-line or off-line the status (**colour**) changes immediately.

Log Out

Send

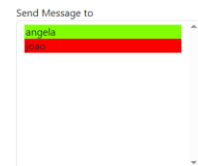

Speak

In order to use this feature first you need to follow the steps

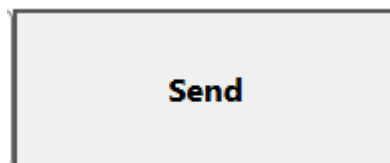

1 – Click in the button called (**Speak**)

2- Click in the same button now called (**Stop**)

3- Click in the button called (**Send**) in order to send the audio message.

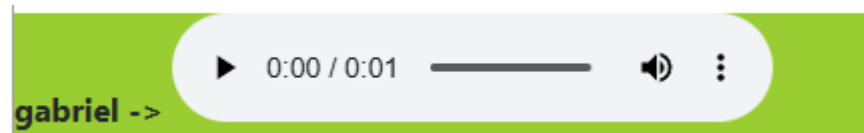

4 – After send the message. The user should be able to see this HTML component, which allows playing the audio message sent as well income messages.

Message sent, to a user. Has a yellow margin.

mendonca chat : gabriel

Messages received has a green margin.

- Text message

This project allows the user to also send text messages to another user.

How are you ?

Send

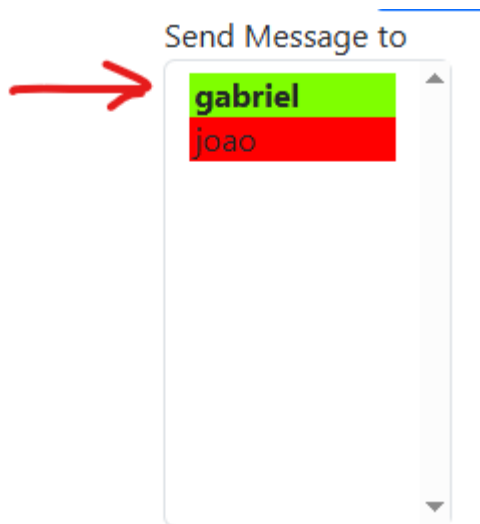

Speak

In order to send the message to some user, first you need so select a user to send the message, and after type the message, then the send bottom will be unblock to send text message.

- Highlight income messages

This feature highlight income messages.

If the user is not current select, the name will be highlight in case of unread messages.

- Creation new users

Before to be able to send and receive a message from the users it is required to have at least two users saved previously on the project, in order to achieve its required to a post request

On the end-point - **/security/register** with the body showed below – **Post request**

```
{
  "userName": "joao",
  "password": "app",
  "role": "admin"
}
```

Observations – After save the first two users it will be required to restart the application in order to have those users load in the project.
